COURSE CODE

EAPMD

SUB CATEGORY

CLOUD COMPUTING

PKUFESSIONAL ELYSIUM ACADEMY MICROSOFT PROFESSIONAL

COURSE DESCRIPTION

Microsoft Devops Engineer Expert is created in a way that even complete beginners will feel at ease with the direction of the course. The Azure DevOps Solutions Expert master's program is designed for professionals who want to work in DevOps and Cloud Computing

COURSE GOALS

The key tenets of cloud computing and how Microsoft Azure has applied them. Speed on Azure services, security, privacy, compliance, trust, pricing, and support

FUTURE SCOPE

Responsibilities for this role include designing and implementing strategies for collaboration, code, infrastructure, source control, security, compliance, continuous integration, testing, delivery, monitoring, and feedback. DevOps engineers work on cross-functional teams that include developers, site reliability engineers, and Azure administrators. DevOps engineers must have experience with administering and developing in Azure, with strong skills in at least one of these areas. They should be familiar with both Azure DevOps and GitHub.

CHAPTER CHAPTER

CONFIGURE ACTIVITY TRACEABILITY AND FLOW OF WORK

- O1. Plan and implement a structure for the flow of work and feedback cycles
- O2. Identify appropriate metrics related to flow of work, such as cycle times, time to recovery, and leadtime
- O3. Integrate Azure Pipelines and GitHub Actions with work item tracking tools
- O4. Implement traceability policies decided by development
- O5. Integrate a repository with Azure Boards

CHAPTER

CONFIGURE COLLABORATION AND COMMUNICATION

O1. Communicate actionable information by using custom dashboards in Azure Boards

- O2. Document a project by using tools, such as wikis and process diagrams
- O3. Configure release documentation, including release notes and API documentation
- O4. Automate creation of documentation from Git history
- O5. Configure notifications by using webhooks

DESIGN AND IMPLEMENT A SOURCE CONTROL STRATEGY

- O1. Design and implement an authentication strategy
- O2. Design a strategy for managing large files, including Git LFS and git-fat
- O3. Design a strategy for scaling and optimizing a Git repository, including Scalar and cross-repositorysharing
- 04. Implement workflow hooks

PLAN AND IMPLEMENT BRANCHING STRATEGIES FOR THE SOURCE CODE

HRS

- O1. Design a branch strategy, including trunk-based, feature branch, and release branch
- O2. Design and implement a pull request workflow by using branch policies and branch protections
- O3. Implement branch merging restrictions by using branch policies and branch protections

CHAPTER

CONFIGURE AND MANAGE REPOSITORIES

- O1. Integrate GitHub repositories with Azure Pipelines
- O2. Configure permissions in the source control repository
- O3. Configure tags to organize the source control repository
- O4. Recover data by using Git commands
- O5. Purge data from source control

DESIGN AND IMPLEMENT PIPELINE AUTOMATION

- O2. Design and implement quality and release gates, including security and governance
- O3. Design integration of automated tests into pipelines
- O4. Design and implement a comprehensive testing strategy (including local tests, unit tests, integration tests, and load tests)
- 05. Design and implement UI testing
- O6. Implement orchestration of tools, such as GitHub Actions and Azure Pipelines

CHAPTER

DESIGN AND IMPLEMENT A PACKAGE MANAGEMENT STRATEGY

O1. Design a package management implementation that uses Azure Artifacts, GitHub Packages, NuGet, and npm

- O2. Design and implement package feeds, including upstream sources
- O3. Design and implement a dependency versioning strategy for code assets and packages, including semantic versioning and date-based
- O4. Design and implement a versioning strategy for pipeline artifacts

DESIGNAND IMPLEMENT PIPELINES

HRS

- O1. Select a deployment automation solution, including GitHub Actions and Azure Pipelines
- O2. Design and implement an agent infrastructure, including cost, tool selection, licenses, connectivity, and maintainability
- O3. Develop and implement pipeline trigger rules
- O4. Develop pipelines, including classic and YAML

CHAPTER CHAPTER

DESIGN AND IMPLEMENT A STRATEGY FOR JOB EXECUTION ORDER, INCLUDING PARALLELISM AND MULTI-STAGE

- O1. Develop complex pipeline scenarios, such as containerized agents and hybrid
- O2. Configure and manage self-hosted agents, including virtual machine (VM) templates and containerization
- O3. Create reusable pipeline elements, including YAML templates, task groups, variables, and variable groups
- O4. Design and implement checks and approvals by using YAML environments

GHAPTER

DESIGN AND IMPLEMENT DEPLOYMENTS

O2. Design a pipeline to ensure reliable order of dependency deployments

- O3. Plan for minimizing downtime during deployments by using VIP swap, load balancer, and rolling deployments
- O4. Design a hotfix path plan for responding to high-priority code fixes
- O5.Implement load balancing for deployment, including Azure Traffic Manager and the Web Apps feature of Azure App Service
- O6. Implement feature flags by using Azure App Configuration Feature Manager
- O7. Implement application deployment by using containers, binary, and scripts

DESIGNAND IMPLEMENT INFRASTRUCTURE AS CODE (LAC)

- O1. Recommend a configuration management technology for application infrastructure
- O2. Implement a configuration management strategy for application infrastructure, including IaC

- O3. Define an IaC strategy, including source control and automation of testing and deployment
- O4. Design and implement desired state configuration for environments, including Azure Automation State Configuration, Azure Resource Manager, Bicep, and Azure Automanage Machine Configuration

THE CHAPTER

MAINTAIN PIPELINES

- O1. Monitor pipeline health, including failure rate, duration, and flaky tests
- O2. Optimize pipelines for cost, time, performance, and reliability
- O3. Analyze pipeline load to determine agent configuration and capacity
- O4. Design and implement a retention strategy for pipeline artifacts and dependencies

THE CHAPTER

DESIGN AND IMPLEMENT A STRATEGY FOR MANAGING SENSITIVE INFORMATION IN AUTOMATION

- O1. Implement and manage service connections
- O2. Implement and manage personal access tokens
- O3. Implement and manage secrets, keys, and certificates by using Azure Key Vault, GitHub secrets, and Azure Pipelines secrets
- O4. Design and implement a strategy for managing sensitive files during deployment
- O5. Design pipelines to prevent leakage of sensitive information

CHAPTER

AUTOMATE SECURITY AND COMPLIANCE SCANNING

O1. Automate analysis of source code by using GitHub code scanning, GitHub secrets scanning, pipeline-based scans, and SonarQube

HK2

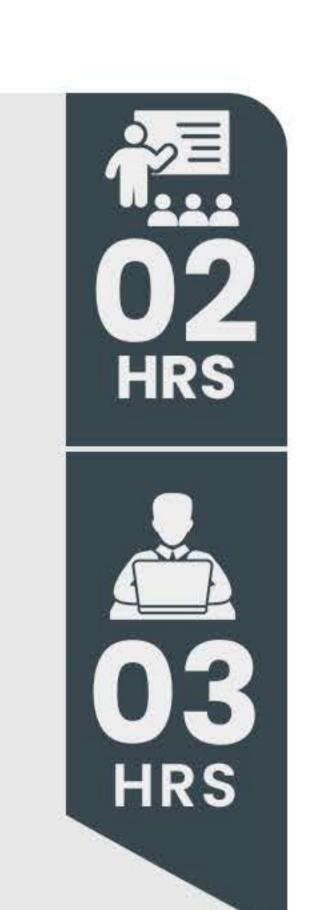

- O2. Automate security scanning, including container scanning and OWASP ZAP
- O3. Automate analysis of licensing, vulnerabilities, and versioning of open-source components by using Mend Bolt and GitHub Dependency Scanning

CONFIGURE MONITORING FOR A DEVOPS ENVIRONMENT

- O1. Configure and integrate monitoring by using Azure Monitor
 - O2. Configure and integrate with monitoring tools, such as Azure Monitor and Application Insights
 - O3. Manage access control to the monitoring platform
 - 04. Configure alerts for pipeline events

THE CHAPTER

ANALYZE METRICS

- O1. Inspect distributed tracing by using Application Insights
- O2. Inspect application performance indicators

- O4. Identify and monitor metrics for business value
- O5. Analyze usage metrics by using Application Insights
- O6. Interrogate logs using basic Kusto Query Language (KQL) queries
